

Monte Carlo Sensitivity Analysis ($N = 1000$ draws: $\mathcal{K} \pm 50\%$, $\Gamma \pm 30\%$, shock $\pm 30\%$)

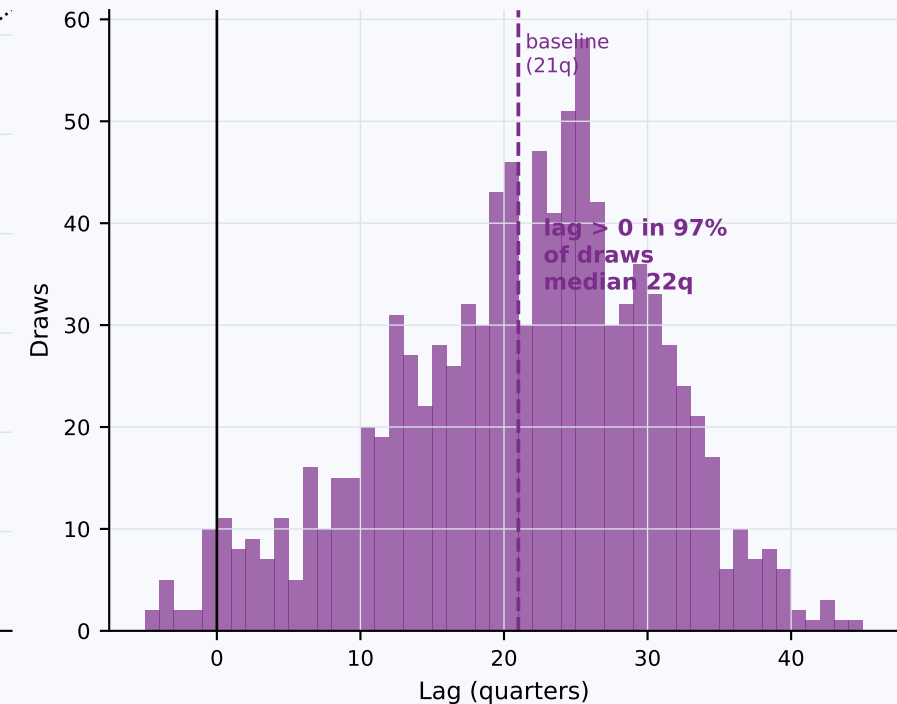

(A) Recovery time distributions
(baseline policy spec)

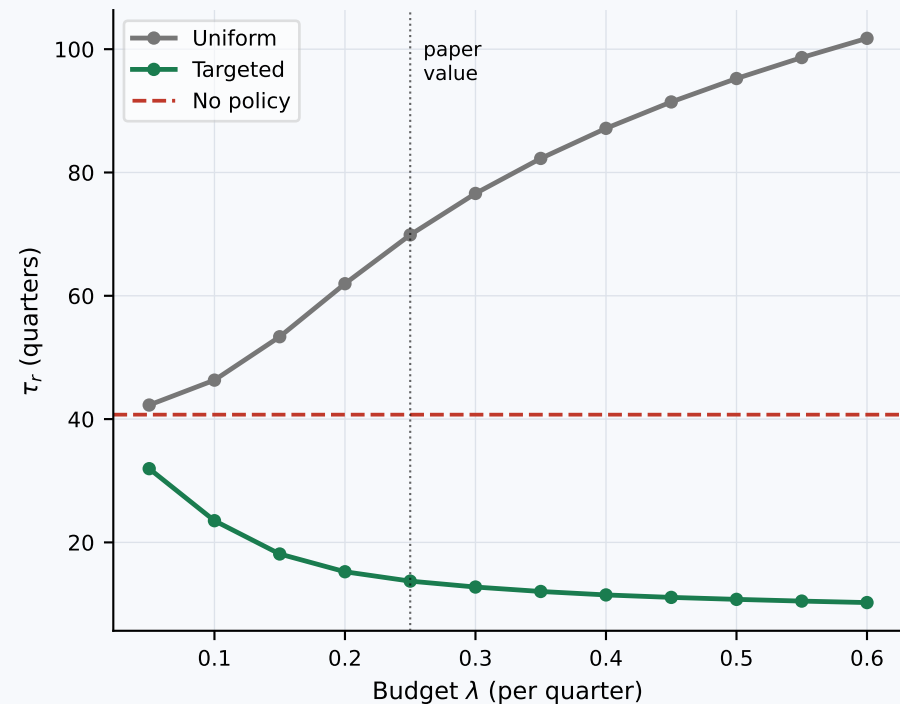

(B) Symmetric exit rule:
targeted vs uniform, per draw

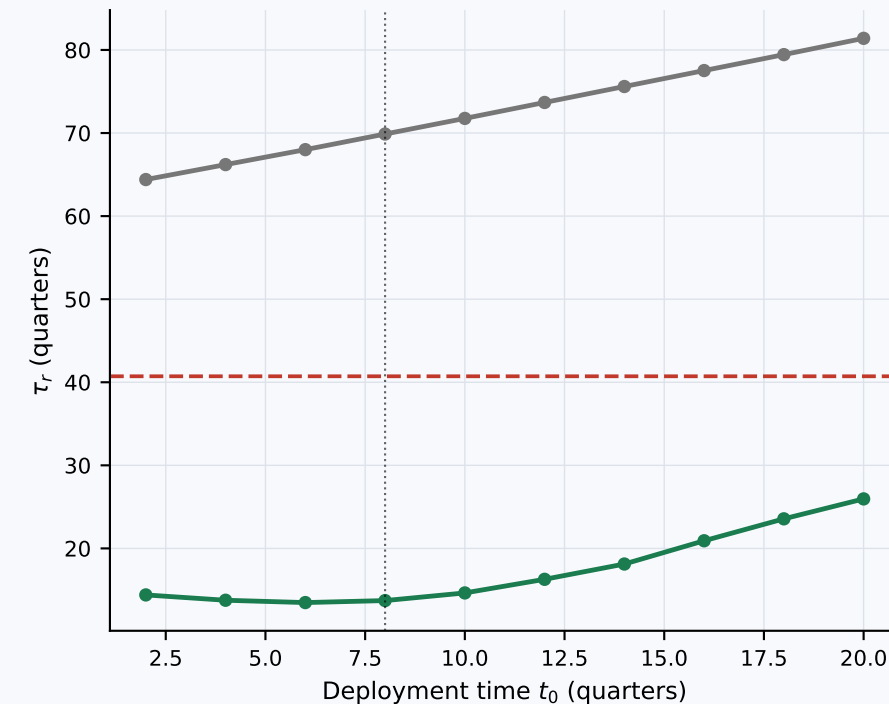

(C) Structural lag $t_{rec}(D_{KL}) - t_{rec}(|\Delta S|)$

(D) Budget sweep (baseline calibration)

(E) Deployment-time sweep

(F) Epicentre / aggregate peak-drop ratio
